SUMMARY

Technical Product Manager with 10 years of experience across product management, UX, and software engineering. I have taken AI, marketplace, real-estate, commerce, and internal-operations products from problem definition and roadmap through requirements, implementation, QA, launch, and production support. My engineering background helps me make technically grounded product decisions and work directly with design, frontend, backend, QA, and business stakeholders.

Selected outcomes: launched and monetized Apex; reduced LLM spend by about 95%; cut First Choice mobile LCP from 9.6 to 2.8 seconds; reduced Vibe's main bundle from 1.4MB to 165kB; kept company coordination running for about 40 people during an internet shutdown.

CORE SKILLS

Product Management: product discovery, problem framing, strategy, roadmaps, prioritization, PRDs, user stories, acceptance criteria, stakeholder management, KPIs, launch planning, pricing, and monetization.

Technical Delivery: requirements breakdown, API contracts, frontend/backend dependencies, technical trade-offs, QA strategy, defect triage, release readiness, and production operations.

AI Products: LLM workflow design, prompt engineering, structured outputs, model selection, evaluation and guardrails, deterministic preprocessing, and cost/latency optimization.

UX & Engineering: user flows, UI/UX, design systems, React, TypeScript, Python, FastAPI, PostgreSQL, Redis, Docker, REST APIs, and RTL interfaces.

Trust & Operations: reviews and reputation, KYC/KYB, moderation, fraud and spam prevention, support workflows, admin tooling, privacy, and appeals.

EXPERIENCE

Selected product, engineering, and company-building experience. Some periods overlap because I built products alongside client and company work.

AI Product Manager - Apex | apexpnl.com | 2025 - Present

Live, monetized AI-powered market-analysis product for traders, analysts, and market participants across supported assets.

- Own product strategy, roadmap, UX, pricing, launch, and production operations for a live, paid market-intelligence product with prepaid credit and server-authoritative usage accounting.
- Turned several years of TradingView/Pine Script research into Python services that calculate market state, levels, conflicts, and risk before the LLM explains the structured evidence.
- Designed analysis workflows across 4 asset classes: 500+ crypto pairs, 10 major forex pairs, XAU/USD, and 14 stock/ETF tickers, with structured results generated in about 30 seconds.
- Reduced LLM spend by about 95% by removing roughly 80 redundant daily model calls, using a lower-cost model, and moving repeatable analysis into deterministic services.
- Designed the complete trader journey, including analysis configuration, credit use, history, and a Panic flow for risk-focused support during an open trade.
- Handle product and engineering end to end, including the production architecture and operation of the FastAPI, Celery, Redis, PostgreSQL, React, TypeScript, Docker, nginx, and Cloudflare stack.

Technical Product Lead & Senior Frontend Engineer - Vibe | vibeapp.ir | 2023 - Present

Two-sided local-business discovery and reputation platform for Iran, focused on trustworthy reviews, business profiles, discovery/search, and business-owner tools.

- Co-created the product after identifying a local trust gap, then defined the core marketplace loop, product strategy, layered roadmap, and cross-functional delivery order.
- Designed the complete UX and built the frontend from zero across the customer, business-owner, and admin surfaces, establishing the RTL design system and shared application architecture.
- Prioritized profiles, reviews, and discovery first; then KYC/KYB, claims, moderation, support, admin operations, and finally packages and subscriptions.
- Scoped AI-assisted review quality, explainable rating recommendations, review summaries, optional identity verification, and moderation workflows with clear user control and privacy boundaries.
- Established launch readiness across critical journeys by connecting API contracts, requirement traceability, risk-based QA, and P0/P1/P2 defect triage and retesting.
- Reduced the main JavaScript bundle from 1.4MB to 165kB through route-level code splitting and frontend performance work.

Technical Product Lead & Full-stack Developer - Selected Client Products | 2026

Independent product delivery from discovery and UX through implementation, launch, and production support.

- **First Choice:** rebuilt a live real-estate platform across Persian, English, and Arabic, connecting public property discovery and lead intake with private staff workflows and day-to-day publishing.
- **First Choice:** improved mobile Lighthouse performance from 53 to 95 and LCP from 9.6 to 2.8 seconds through selective prefetching, caching, image work, and rendering changes.
- **Hosseintalab:** designed the experience around the main uncertainty in buying a handwoven carpet remotely: seeing the exact full piece, knowing its price and origin, and reaching an expert directly.

Product Owner & Engineer - MRM (Internal Continuity Tool) | 2026

Self-hosted company messenger built under urgent restricted-network conditions.

- Scoped, designed, built, and deployed MRM during an internet shutdown; about 40 people used it for company coordination until normal access returned.
- Designed for restricted-network continuity with self-hosted company control, offline queuing and recovery, domestic dependencies, and PWA access, avoiding reliance on unavailable international services.

Managing Director & Product Delivery Lead - Monorro | monorro.ir | 2020 - 2024

Software company delivering websites, web applications, recovery work, and custom software services.

- Led client discovery, scoping, commercial proposals, delivery coordination, quality standards, and executive operations; converted recurring small-business needs into a standardized web-presence offer.

Product Lead (Independent Product) - MonoCoin | monocoin.net | 2019 - 2023

Paid market-signals and automation subscription product.

- Built and operated an end-to-end subscription system connecting proprietary Pine Script signals through TradingView webhooks to Telegram delivery and Cornix trade automation.
- Grew the product organically to 300+ paying members and an audience of 13,000+; owned pricing, retention, and subscriber experience.

Earlier Roles | 2016 - 2021

- **The Pol / Beshknow:** delivered an in-store music platform for shops, cafes, and restaurants; also completed independent frontend and market-analysis engagements.

EDUCATION & LANGUAGES

MBA, Technology Management - IAU Central Tehran (2026). GPA 3.9 / 4.0.

Thesis published at the First National Conference on Smart Governance (Tehran University - IAU Central Tehran): PLS-SEM study linking digital technology, innovation, and productivity, case study: Snapp.

Bachelor of Architecture.

Languages: English - professional working proficiency (IELTS 7.5). Persian - native.
